Batch Class Rescue

Date	August 7, 2009
Revision	1.0

Batch Class Rescue Overview

Batch Class Rescue creates importable cab files from published Batch Classes in the PubTypes folder. It does this without any access to the Capture database, thus can be used to recover Batch Classes in an environment where the database is unrecoverable but the file share remains.

It may also be used to recover a previous version of a published Batch Class if that version still exists in the PubTypes folder.

Please note BatchClassRescue.exe and its dependency CabLib130.dll must be in the same folder.

Features

- Recovers Batch Classes in situations where they would otherwise be unrecoverable.

- Browse to load PubTypes from any folder, defaulting to ServerPath\PubTypes if found in registry.

- After loading, basic structure for each Batch Class is displayed below.

- Once loaded, save to any folder. Each loaded Batch Class will be saved as an individual importable cab file.
